Form Approved  
OMB No. 0704-0188

Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing this collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

MEMORANDUM FOR PRS (Contractor/In-House Publication)

FROM: PROI (STINFO)

13 Apr 2001

SUBJECT: Authorization for Release of Technical Information. Control Number: **AFRL-PR-ED-TP-2001-084**  
Karl O. Christe, W.O. Wilson, A. Vij, V. Vij, J. Sheehy, J. Boatz, S. Schneider, T. Schroer, R. Wagner,  
N. Maggiasora, R. Haiges, "Polynitrogen Chemistry and the Pursuit of New High Energy Density  
Materials"

**AFOSR Molecular Dynamics Conference**  
**(Irvine, CA, 19-23 May 2001) (Deadline: Past - 02 Apr 01 )**

(Statement A)

1. This request has been reviewed by the Foreign Disclosure Office for: a.) appropriateness of distribution statement, b.) military/national critical technology, c.) export controls or distribution restrictions, d.) appropriateness for release to a foreign nation, and e.) technical sensitivity and/or economic sensitivity.

Comments: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Signature \_\_\_\_\_

Date \_\_\_\_\_

2. This request has been reviewed by the Public Affairs Office for: a.) appropriateness for public release and/or b) possible higher headquarters review.

Comments: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Signature \_\_\_\_\_

Date \_\_\_\_\_

3. This request has been reviewed by the STINFO for: a.) changes if approved as amended, b.) appropriateness of references, if applicable; and c.) format and completion of meeting clearance form if required

Comments: \_\_\_\_\_  
\_\_\_\_\_

The goal of this AFOSR program is the synthesis of novel polynitrogen-derived HEDM compounds, exploiting the synergism between theory and synthesis.

Under combined DARPA, AFOSR and NSF sponsorship, we have discovered in 1999 the novel polynitrogen compound,  $N_5^+AsF_6^-$ . The  $N_5^+$  cation is only the third known, homoleptic polynitrogen species that can be prepared and isolated in bulk, the other two being  $N_2$  and the azide anion.  $N_5^+AsF_6^-$  was found to be only marginally stable. During the past year, the  $N_5^+$  cation has successfully been tamed by preparing the stable fluoroantimonate salts,  $N_5^+SbF_6^-$  and  $N_5^+Sb_2F_{11}^-$ . The former is surprisingly stable (up to 70 °C) and, according to drop weight tests, is essentially insensitive. The crystal structure of  $N_5^+Sb_2F_{11}^-$  was determined, and the geometry of  $N_5^+$  was found to be in excellent agreement with that predicted by our theoretical calculations. A considerable amount of effort was spent on improving the syntheses of the precursors for the  $N_5^+$  salts. This work resulted in the discovery of a new *cis-trans* isomerization process for  $N_2F_2$ , a disproportionation reaction of  $N_2F_2$  to give  $NF_4^+Sb_2F_{16}^-$  under mild conditions, and several new crystal structures for salts that contain nitrogen fluoride cations. Also, a safer method for producing  $N_5^+$  salts was developed to overcome a series of explosions, encountered in the  $N_5SbF_6$  synthesis. Metathetical reactions were carried out in  $SO_2$  and anhydrous HF solutions between  $N_5^+SbF_6^-$  and alkali metal azides, perchlorates, and nitrates, in pursuit of  $N_3N_3$ ,  $N_3ClO_4$ , and  $N_3NO_3$ , respectively. It was also found that the  $N_3^-$  anion reacts with  $SO_2$  under formation of the novel  $SO_2N_3^-$  anion that was characterized by its crystal structure, vibrational spectroscopy, and theoretical calculations. Furthermore, reactions of  $N_2F_3^+$  and  $N_2F_2$  with  $HN_3$  were studied in efforts to prepare the  $N_{11}^+$  cation. The  $N_2F_3^+$  cation was initially reduced by  $HN_3$  to  $N_2F^-$  that then proceeded to react with  $HN_3$  to give the known  $N_5^+$  cation.

While carrying out structural studies of the  $NF_2O^+$  cation, which is another potential precursor for polynitrogen compounds, a new method for solving oxygen/fluorine positionally disordered crystal structures was discovered. This method was also successfully demonstrated for the  $SO_2F^-$  anion. In both cases, it was shown that the crystal structures obtained from disordered data sets with our method were in excellent agreement with those predicted by the theoretical calculations for the free gaseous ions.

In pursuit of novel powerful oxidizers that might be stronger than any presently known oxidizer, the following new concept was developed and tested. Cations are stronger oxidizers than their neutral parent molecules, which in turn are stronger oxidizers than their anions. Therefore, transition metal fluoride anions were prepared in their highest oxidation states by high temperature / high pressure fluorinations with elemental fluorine and then converted to the corresponding cations by acidification with strong Lewis acids. The resulting, thermally unstable cations are indeed very powerful oxidizers. This was successfully demonstrated for the  $NiF_3^+$  system, which was shown to be capable of oxidizing  $ClF_3$  and  $BrF_3$  to  $ClF_6^+$  and  $BrF_6^+$ , respectively. However, attempts to use this system for the preparation of the new  $OF_3^+$  or  $XeF_7^+$  cations were not successful. In a quest for finding the strongest possible oxidizer, the oxidizing strength of numerous transition metal fluoride cations that can be prepared in this manner, are presently being calculated by ab initio methods in collaboration with Dave Dixon. In connection with this work, the crystal structures of  $ClF_6^+$ ,  $BrF_6^+$ , and  $IF_6^+$  were determined in collaboration with McMaster University and their force fields were calculated by ab initio methods.

The study of the  $ClF_4^+$  cation, which was started last year, was completed, and extensive theoretical modeling of the influence of strong intermolecular fluorine bridging on the structure and the vibrational spectra was carried out. A simple method for simulating infinite chains by capping with HF was devised and shown to give excellent results. Results from a theoretical study of the closely related  $BrF_4^+$  and  $IF_4^+$  cations strongly disagreed with the previously reported crystal structures and prompted their reinvestigation. It was shown that the previously reported structures were indeed in error and that the correct structures are in excellent agreement with the theoretical predictions. In the case of  $IF_4^+SbF_6^-$  a very interesting 9-coordinated environment was found for  $IF_4^+$ . In collaboration with Arkady Ellern, the crystal structure of solid  $ClF_3O$  was also determined and shown to consist of unusual tetrameric units.

Attempts to prepare and characterize the yet unknown  $PO_2^+$  cation, the analogue to the well-known  $NO_2^+$  cation, resulted in a surprise. Acidification of  $PO_2F_2$  salts with  $SbF_5$  did not produce the expected  $PO_2^+SbF_6^-$  salt, but a tetrameric ring structure with P-O-Sb bridges and terminal P-F bonds.
